No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 6936706

GENERAL INFORMATION:

APPLICANT: do Couto, Fernando J.R.

Ceriani Dr., Roberto L.

Peterson Dr., Jerry A.

Padlan Dr., Eduardo A.

TITLE OF INVENTION: Analogue Peptides with Specificity

for Carcinomas and Kit and Diagnostic Vaccination
and Therapeutic Methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          94.6%; Score 53; DB 2; Length 9; 88.9%; Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 8, Application US/10473037

Publication No. US2050266A1

GENERAL INFORMATION:

APPLICANT: KYOWA HAKKO KOGYO CO., LTD.

TITLE OF INVENTION: Agents for treatment of cancer using recombinant anti-GD3 antibod

TITLE OF INVENTION: He antibody fragments

FILE REFERENCE: 11374WO1

CURRENT APPLICATION NUMBER: US/10/473,037

CURRENT FILING DATE: 2003-09-26

FRIOR FILING DATE: 2001-03-29

NUMBER OF SEQ ID NOS: 50

SOFTWARE: PatentIN Ver. 2.0

Patent No. 6610836
GENERAL INFORMATION
GENERAL INFORMATION
APPLICANT: GATY Breton et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: PREMONIAE FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 2709.2004001
CURRENT APPLICATION NUMBER: US/09/489,039A
CURRENT APPLICATION NUMBER: US 60/117,747
PRIOR APPLICATION NUMBER: US 60/117,747
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        APPLICANT: Homburger et al.

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster FILLE REFERENCE: FILE REFERENCE: 7136-094
CURRENT APPLICATION NUMBER: US/09/270,767
CURRENT FILING DATE: 1999-03-17
NUMBER OF SEQ ID NOS: 62517
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 45401
LENGTH: 349

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 7439, Application US/09328352
Sequence 7439, Application US/09328352
Patent No. 6562958
GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE OF INVENTION: MUGHER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 7439
                                                                                                                                                                                                                                                       Sequence 13, Application US/08913159
Fatent No. 6300109
GENERAL INFORMATION:
FAPLICANT:
TITLE OF INVENTION: restriction-modification systems from Lactococcus lactis
TITLE OF INVENTION: restriction-modification systems from Lactococcus lactis
TITLE OF INVENTION: restriction-modification systems from Lactococcus lactis

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with

```
hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGFTR and/or EGFR. This sequence represents an consequence used to generate the Ab of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   neoplasm; prostate tumor; andrology; genitourinary disease; osteosarcoma; musculoskeletal disease; respiratory disease; lung tumor; endocrine disease; gynecology and obsterincs; breast tumor; endometroid carcinoma; gastrointestinal disease; colon tumor; antipsoriatic; psoriasis; dermatological disease; immune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody or its functional fragment, being capable of binding human IGF-IR and specifically inhibiting tyrosine kinase activity of receptor,

comprising a light or heavy chain having at least one complementary determining a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (AD267006 and AD267014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illiness connected with an overexpression and/or an abnormal activation of the IGF-IR and/or EGFR, and/or connected with a horizon of the Iransduction pathway of the signal mediated by the interaction of the transduction pathway of the signal mediated by the interaction of the transformation of preparation of the insulin receptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral receptor. The antibody is useful for preparation of a medicament intended to inhibit the growth capendent and/or EGF-dependent, especially IGF1 and/or IGF2.

Consequence in and/or EGF-dependent and/or EGF-dependent and/or the proliferation of a medicament intended to inhibit the growth and/or the proliferation of tumor cells, preferably IGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent of a medicament intended for prevention or for the treatment of cancer, where the cancer, endometrial cancer or colon cancer. (I) is useful in the cancer of preparation of a medicament intended for the prevention or colon cancer. (I) is useful in vitro diagnosis of illnesses induced by an overappression or an underexpression of the IGF-IR and/or EGFR receptor is useful for in vitro diagnosis of illnesses induced by an overappression or an underexpression of the halvention. The present of sequence is supported, which involves contacting the receptor is useful for in vitro diagnosis of illnesses induced or the present of is suspected, which the halvent intended for the exemplification of the invention.

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-1R) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-1R. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-1R and/or receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit transformation of tumor cells, so are useful against cancers of the proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-1R and/or EFR. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cytostatic; antipsoriatic; antibody; inf-1R; tyrosine kinase activity; insulin-like growth factor-1 receptor; IGF-1R; tyrosine kinase activity; or epidermal growth factor receptor; BGFR; signal transduction pathway; ligand; tumor; cancer; osteosarcoma; complementarity determining region; CDR.
                                                                                   New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.

                                              The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-1R) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or-2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-1R. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-1R and/or spidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit prowth and/or proliferation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-1R and/or EGFR. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine

Ab and its fragments are used to prevent or reat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Bapecially they inhibit transformation of normal cells, to are useful against cancers of the
kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             insulin-like growth factor-1 receptor; IGF-IR; tyrosine kinase activity; or epidermal growth factor receptor; EGFR; signal transduction pathway; ligand; tumor; cancer; osteosarcoma; complementarity determining region; CDR.

(GOET/) GOETSCH L.

Murine immunoglobulin heavy chain variable region 7C10 VH SEQ ID NO:69.

```
The invention relates to a novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of specifically inhibiting tynosine kinase activity of the receptor, operation of binding to heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADS67014). An antibody of the invention is useful in a determining region (CDR) consisting of one of two fully defined 16 amino acids (ADS67016 and ADS67014). An antibody of the invention of a medicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal activation of the IGF-IR and/or EGFR, and/or connected with an antibody of the signal mediated by the interaction of the IGF-IR and/or EGFR, and/or of EGF with EGFR, where continues secondary effects connected with inhibition of the insulant receptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral character, preferably IGF-dependent, especially IGF1 and/or IGF2-dependent and/or EGF-dependent cells, it is useful in the preparation of a medicament intended for prevention or the preparation of a medicament intended for prevention or ancer. (I) is useful in the preparation of a medicament intended for prevention or ancer. (I) is useful in the preparation of a medicament intended for prevention or colon cancer. (I) is useful in the preparation of a medicament intended for the specific targeting of a biologically active compound to retarge transforment of psorialss. (I) is useful in the abnormal presence, of IGF-cells expressing or overexpression or an underexpression of the IGF-IR and/or EGFR receptor is useful in the exemplification of the invent

Example 13; SEQ ID NO 69; 125pp; English.

Treceptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of gradifically inhibiting tyrosine kinase activity of the receptor.

Comprising a light or heavy chain having at least one complementary comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADEG-ONG) and ADEG-ONJ. An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of the IGF-IR and/or connected with a noverexpression and/or an abnormal activation of the IGF-IR and/or connected with a hyperactivation of the transduction pathway of the signal mediated by the interaction of IGF-IR and/or of EGF with EGFR, where the administration of the medicament does not induce or only slightly induces secondary effects connected with inhibition of the insulin conduces secondary effects connected with inhibition of the insulin conduces secondary effects connected with inhibition of the insulin conduces secondary effects connected with inhibition of the insulin conduces secondary effects connected with inhibition of the insulin conduces secondary effects connected with inhibition of the insulin conducts of intended to inhibit the transformation of normal cells with tumoral character, preferably IGF-dependent, especially IGF1 and/or IGF2-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or IGF2-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent cells, preferably IGF-dependent and/or IGF2-adependent cells, preferably IGF-dependent cells, preferably IGF-dependent cells, preferably IGF-dependent cells, preferably IGF-dependent cells in the prevention of a medicament intended for the prostate cancer, colon cancer. (I) is useful in preparation of a medicament intended for the specific targeting or overexpressing or overexpressing or overexpressing or overexpressio invention relates to a novel isolated anti-insulin-like growth factor

or an intense counterceau with an overcoppression analysis and contracted with a citivation of the Iransduction pathway of the signal mediated by the hyperactivation of the transduction pathway of the signal mediated by the interaction of IGF1 or IGF2 with IGF-IR and/or of EGF with EGFR, where the administration of the medicament does not induce or only slightly receptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral chearacter, preferably IGF-dependent, especially IGF1 and/or IGF2.

Character, preferably IGF-dependent, especially IGF1 and/or IGF2.

Character, preferably IGF-dependent and/or IRRZ/hou-dependent cells. (I) is useful for preparation of a medicament intended to inhibit the growth especially IGF-and/or IGF2-dependent and/or IGF-dependent and/or IGF-dependent cells. (I) is useful in the preparation of a medicament intended for prevention or for the treatment of cancer, where the cancer is chosen from prostate cancer, osteosarcoma, lung cancer, breast cancer, endometrial cancer or colon cancer. (I) is useful in the preparation of a medicament intended for the specific targeting of a biologically active compound to cancer seconds in vitro diagnosis of intended by an undarances of invarances of in vitro diagnosis of illnesses induced by an overcence of the cancer of intended by an undarance of invarances of intended by an undarance of invarances.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 overexpression or an underexpression of the IGF-IR and/or EGFR receptor starting from a biological sample in which the abnormal presence, of IGF-IR and/or EGFR receptor is suspected, which involves contacting the biological sample with (1), which is optionally labeled. The present

                                                                          The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or repidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lumg, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Insulin-like growth factor 1 receptor; antibody; tumor; cytostatic; neoplasm; prostate tumor; andrology; genitourinary disease; osteosarcoma; musculoskeletal disease; respiratory disease; lung tumor; endocrine disease; gynecology and obstetrics; breast tumor; endometroid carcinoma; gastrointestinal disease; colon tumor; antipporiatic; psoriasis; dermacological disease; immune disorder; immunoglobulin; heavy chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Murine immunoglobulin heavy chain variable region 7C10 VH SEQ ID NO:52.
New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.

RESULT 13 ADJ76911 ADJ76911;

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-1R) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-1R. Ab and its fragments are used to prevent or read diseases associated with overexpression and/or abnormal activity of IGF-1R and/or eceptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit prowth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-1R and/or EGFR. This sequence represents a

```
New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.
                                                                                                                                                                                                                                            Disclosure; SEQ ID NO 81; 164pp; French.

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-18) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF.1R. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-1R and/or epidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit growth and/or proliferation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
